The site is just the next generation network and communication management software that supports major area of the network including server, client, 3D virtualization, cloud, mobility and Web services. VOS3000 is a unified solution for various WAN and networking vendors. Q: Is it possible to have multithreaded requests? I'm in the process of developing a winforms application for a commercial project. The issue I'm facing is that most of my app is done in the form of WPF user controls. These controls are rendering to a canvas by writing directly to it. While in theory I could be using WPF for the winforms app, it would require a lot of rewriting of my existing code. What I'm wondering is whether it is possible to have several threads rendering to the canvas, each one being responsible for a part of the overall visual output? Thanks in advance. A: yes it is possible to do so. the thing is whether or not you need that kind of multithreading. if you can stick to a single thread only then you can do it. 82157476af
